## Legal Notice

The Ethylene Oxide Product Stewardship Guidance Manual was prepared by the American Chemistry Council's Ethylene Oxide/Ethylene Glycols Panel (Panel). It is intended to provide general information to persons who may handle or store ethylene oxide. It is not intended to serve as a substitute for in-depth training or specific handling or storage requirements, nor is it designed or intended to define or create legal rights or obligations. It is not intended to be a "how-to" manual, nor is it a prescriptive guide. All persons involved in handling and storing ethylene oxide have an independent obligation to ascertain that their actions are in compliance with current federal, state and local laws and regulations and should consult with legal counsel concerning such matters. The manual is necessarily general in nature and individual companies may vary their approach with respect to particular practices based on specific factual circumstance, the practicality and effectiveness of particular actions and economic and technological feasibility. Any mention of specific products in this manual is for illustration purposes only and is not intended as a recommendation or endorsement of such products.

Neither the American Chemistry Council, nor the individual member companies of the Ethylene Oxide/Ethylene Glycols Panel, nor any of their respective directors, officers, employees, subcontractors, consultants, or other assigns, makes any warranty or representation, either express or implied, with respect to the accuracy or completeness of the information contained in this manual; nor do the American Chemistry Council or any member companies assume any liability or responsibility for any use or misuse, or the results of such use or misuse, of any information, procedure, conclusion, opinion, product, or process disclosed in this manual. **NO WARRANTIES ARE GIVEN; ALL IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE ARE EXPRESSLY EXCLUDED.**

This work is protected by copyright. Users are granted a nonexclusive royalty-free license to reproduce and distribute this Manual, subject to the following limitations: (1) the work must be reproduced in its entirety, without alterations; and (2) copies of the work may not be sold.

# To the Reader

## Manual Preparation

As members and affiliated companies of the American Chemistry Council, we support efforts to improve the industry's responsible management of chemicals. To assist in this effort, the American Chemistry Council's Ethylene Oxide/Ethylene Glycols Panel supported the creation and publication of this manual. The Panel is comprised of the following companies:

Balchem Corporation/ARC Specialty Products

BASF Corporation

Bayer Material Science LLC

Celanese Ltd.

Champion Technologies

Croda, Inc.

The Dow Chemical Company

Eastman Chemical Company

Honeywell

Shell Chemical LP

The development of this manual was led by the Panel's Ethylene Oxide Safety Task Group (EOSTG), a group comprised of producers and users of ethylene oxide. The EOSTG functions to generate, collect, evaluate and share information to support product stewardship with regard to ethylene oxide. The EOSTG formed a manual work group, chaired by Keith Vogel of Lyondell Chemical Company, to lead the development of this document. The following work group members provided significant contributions:

Tom Grumbles	Sasol North America
Susan Jackson	BASF Corporation
Robert Lenahan	Bayer MaterialScience LLC
Denis Reeser	The Dow Chemical Company
John Stewart	BASF Corporation
Don Szczepanski	Huntsman Petrochemical Corporation
David Townsend	Celanese Chemicals Ltd.
Randy Viscomi	Balchem Corporation/ARC Specialty Products
Keith Vogel	Lyondell Chemical Company
Mike Wagner	Old World Industries
John Wincek	Croda, Inc.
Gerald Wise	Shell Chemical LP

## Acknowledgements

Many others contributed to the development and editing of this manual, all of whom cannot be listed here; however, the manual work group would like to thank the following individuals for their significant contributions to this publication:

Ralph Gingell	Shell Chemical LP
William Gullede	American Chemistry Council
Karl Loos	Shell Chemical LP
David McCready	The Dow Chemical Company
Kristy Morrison	EO STG Manager, American Chemistry Council
Karyn Schmidt	Assistant General Counsel, American Chemistry Council

## 7.0 Personnel Exposure

### 7.1 Introduction

This Chapter provides an overview of issues related to personnel exposure to EO including selection of personal protective equipment for use in EO service. This Chapter focuses on the requirements of the OSHA EO standard published in the Federal Register on June 22, 1984, and amended on April 6, 1988. The regulation, 29 CFR 1910.1047, should be consulted for specific requirements.

### 7.2 OSHA Standard for Ethylene Oxide

#### Coverage

The OSHA regulation applies to any worker who may be exposed to EO. Operations associated with the production, use, transportation, storage, loading or unloading of EO are covered under this regulatory standard. The only exception to this coverage is the processing, use, or handling of products containing EO where objective, reasonably reliable data demonstrates that the product is not capable of releasing EO in airborne concentrations at or above the action level under expected conditions of processing, use, or handling. Records of the objective data must be maintained if the exemption is used.

#### Exposure Limits

OSHA's Permissible Exposure Limits, or PELs, are the following:

- 1 ppm in air as an 8-hour time weighted average (TWA) concentration
- 5 ppm in air as a 15-minute time weighted average (TWA) concentration - excursion limit (EL)

There is also an action level (AL) at 0.5 ppm as an 8-hour TWA, which triggers certain compliance activities such as exposure monitoring, medical surveillance, and training. The excursion limit is 5 ppm.

### 7.3 Other Exposure Standards/ Recommendations for Ethylene Oxide

#### Immediately Dangerous to Life and Health

The National Institute for Occupational Safety and Health (NIOSH) has quantified exposures to approximately 400 toxic chemicals that could be "Immediately Dangerous to Life and Health" (IDLH). The IDLH exposure value for EO is 800 ppm. The official definition of IDLH is given in 30 CFR 11.3. The IDLH concentration represents an estimate of the maximum concentration of a substance in air from which healthy workers can escape without loss of life or irreversible health effects under conditions of a maximum 30-minute exposure time.

#### Emergency Response Planning Guidelines

The American Industrial Hygiene Association (AIHA) has recommended Emergency Response Planning Guidelines (ERPGs) for a number of substances. For EO, AIHA has recommended an ERPG-3 of 500 ppm, which is "the maximum airborne concentration below which it is believed nearly all individuals could be exposed for up to 1 hour without experiencing or developing life threatening health effects." [1]

The ERPG-2 of 50 ppm for EO is "the maximum airborne concentration below which it is believed nearly all individuals could be exposed for up to 1 hour without experiencing or developing irreversible or other serious health effects or symptoms that could impair an individual's ability to take protective action." [1]

There is no specified ERPG-1 for EO, the "maximum airborne concentration below which it is believed nearly all individuals could be exposed for up to 1 hour without experiencing more than mild, transient adverse health effects or without perceiving a clearly defined objectionable odor."

#### Acute Exposure Guideline Levels

Acute Exposure Guideline Levels (AEGL) for EO were proposed by a National Academy of Sciences committee in September 2006, as set out in Table 7.1 below.

**Table 7.1** AEGL Values for Ethylene Oxide

Classification	10 minute	30 minute	1 hour	4 hour	8 hour	Endpoint
AEGL-1 (Nondisabling)	No values derived					
AEGL-2 (Disabling)	80 ppm (144 mg/m <sup>3</sup> )	80 (144)	45 (81)	14 (25)	7.9 (14)	Developmental toxicity and neurotoxicity
AEGL-3 (Lethal)	360 ppm (648 mg/m <sup>3</sup> )	360 (648)	200 (360)	63 (113)	35 (63)	Lethality

AEGL-1 is the airborne concentration of a substance above which it is predicted that the general population, including susceptible individuals, could experience notable discomfort, irritation, or certain asymptomatic, non-sensory effects. However, the effects are not disabling and are transient and reversible upon cessation of exposure.

AEGL-2 is the airborne concentration of a substance above which it is predicted that the general population, including susceptible individuals, could experience irreversible or other serious, long-lasting adverse health effects, or an impaired ability to escape.

AEGL-3 is the airborne concentration of a substance above which it is predicted that the general population, including susceptible individuals, could experience life-threatening health effects or death.

Data were available for deriving AEGL-2 and -3 values. Values for AEGL-1 were not derived because the odor threshold and concentrations causing mild sensory irritation would be above the AEGL-2 levels causing “disabling effects.” [2]

### Exposure Monitoring

Initial monitoring is required to determine airborne concentrations of EO to which employees are exposed. If concentrations are above the OSHA action level of 0.5 ppm, periodic monitoring is also required. Additional monitoring may be required if there are changes in process, production, control equipment, personnel, or work practices that may result in new or additional exposures. The OSHA regulation requires employees to be notified of any monitoring results within 15 days of receipt of the results.

### Regulated Areas

Regulated areas must be established wherever occupational exposure may exceed the PELs. Those areas must be marked and access limited to authorized persons. Warning signs must be posted around regulated areas stating:

**Figure 7.1** OSHA Warning for EO Regulated Areas

### Methods of Compliance

Where the TWA or excursion limit is exceeded, the employer must establish and implement a written program to reduce employee exposure to or below the TWA and to or below the excursion limit by means of engineering and work practice controls, as required by paragraph (f)(1) of Section 1910.1047, and by the use of respiratory protection where required or permitted under this Section.

The compliance program must include a schedule for periodic leak detection surveys and a written plan for emergency situations as specified in paragraph (h)(i) of the OSHA regulation.

OSHA recognizes that engineering controls are generally not feasible for certain activities, including loading and unloading of railcars, vessel cleaning, and maintenance and repair activities. In cases where engineering controls are not feasible to prevent exposure above either of the PELs, NIOSH-approved respirators must be worn. See the Respiratory Protection discussion in Section 7.5 below for more information on respirator selection.

### Medical Surveillance Program

The employer must provide annual medical surveillance for employees who are or may be exposed to EO at or above the Action Limit, without regard to the use of respirators, for at least 30 days during the year. Specific requirements for surveillance and medical record retention are included in the OSHA standard [3].

### Training

Information and training must be provided to any personnel who are potentially exposed to EO at or above the action limit or excursion limit. Topics for training are specified in the OSHA standard.

### Product Exemptions

Products made from EO or containing EO are exempt from the standard if objective data shows they will not release EO at or above the action level during normal handling or use.

### Written Emergency Plan

An emergency plan must be developed for each workplace where there is a possibility of an emergency. The employer must have a means of promptly alerting affected employees of an emergency occurrence.

### Recordkeeping

The standard contains requirements for retention of medical and exposure records. Other provisions of the standard also contain recordkeeping requirements.

## 7.4 Measuring Exposure

A number of methods are available for monitoring exposure to EO. Many of these involve the use of charcoal tubes and sampling pumps, followed by analysis of the samples by gas chromatography. There are also indicator tube systems specific to

EO that do not require subsequent analysis, with detection limits in the low ppm range. Portable electrochemical EO detector/alarms and passive badge-type monitors for EO exposure are also available.

Appendix D of the OSHA EO standard describes available methods of sampling and analysis. The employer has the obligation of selecting a monitoring method which meets the accuracy and precision requirements of the standard under the employer's field conditions.

## 7.5 Personal Protective Equipment

### Ethylene Oxide Exposure

When there is potential for exposure to EO vapors or liquid, it is important to use the proper protective equipment. EO can be trapped against the skin and can cause severe chemical blistering and burns, which take a long time to heal. When released, EO liquid will quickly change to vapor. If protective clothing with open sleeves and legs is worn, this vapor can readily get underneath the clothing and result in burns. EO can also penetrate protective clothing seams, so it is important to consider suit construction as well.

Even dilute EO solutions can result in severe chemical burns if the skin remains exposed to the solution. Figure 7.2 shows a chemical burn resulting from 90 minutes of exposure to a dilute EO-water mixture absorbed into leather shoes.

**Figure 7.2** Chemical Burn Resulting from Low Concentration of EO in Water

## Eye Protection

Splashes of EO into the eye can cause severe eye irritation with corneal injury. The OSHA EO standard recommends wearing goggles at all times in those areas where there is a risk of splashes from liquid EO. Face shields (visors) provide additional protection when performing any activity in which there is a risk of splashes from liquid EO.

In the non-mandatory Appendix A of the standard, OSHA recommends that contact lenses not be worn where EO exposure potential exists. Where contact with EO can occur, consider the use of contact lenses carefully in the context of overall personal protective equipment policies and practices.

## Protective Clothing

There are many important factors to consider when selecting appropriate personal protective equipment. These can be broadly grouped into two categories: material chemical resistance and material physical properties.

- Material chemical resistance: ideally, the chosen material(s) resists permeation, degradation, and penetration by the respective chemicals.
  - Permeation breakthrough time is the most important factor used to assess material chemical compatibility. The rate of permeation is a function of several factors such as chemical concentration, material thickness, humidity, temperature, and pressure.
  - Degradation involves physical changes in a material resulting from chemical exposure, use, or ambient conditions (such as sunlight). The most common observations of material degradation are discoloration, swelling, loss of physical strength, or deterioration.
  - Penetration is the movement of chemicals through zippers, seams, or imperfections in a protective clothing material.
- Physical properties: other factors to consider include evaluating the material for its
  - Strength, such that it can withstand the physical tasks at hand
  - Resistance to tears, punctures, cuts, and abrasions

- Durability in light of repeated contamination and decontamination
- Flexibility/pliability to allow users to perform needed tasks
- Heat/cold resistance, such that the material maintains its protective integrity and flexibility under hot and cold extremes
- Flame resistance/ability to self extinguish where a fire hazard may be present (such as in the event of a flash fire). For EO service, consider whether a flash oversuit or an EO resistant suit incorporating flash protection may be appropriate.
- Seam quality, such that that garment seams in the clothing are constructed to provide the same physical integrity as the garment material

Many protective clothing materials in common use are permeable to or attacked by EO. Clothing contaminated by EO must either be discarded or decontaminated before reuse. Clothing must be discarded if it has been degraded or has absorbed EO. It is also important to note that EO and aqueous mixtures permeate leather, including leather boots (see Figure 7.2 above). Accordingly, leatherwear contaminated with liquid EO must be discarded because decontamination is not practical.

Materials proposed for use in protective equipment that are not known to be EO-resistant should first be tested to establish their suitability. Test data may be generated from a number of sources, such as materials manufacturers, equipment manufacturers, EO producers or users, researchers, contract laboratories, or others. Published, peer-reviewed data is also available to help evaluate the suitability of the material for EO use.

When evaluating test data, be aware that data may be of varying quality or reliability. Whether the data is well-documented or published, derived from multiple sources, has been subject to repeated testing, has been generated from an independent testing agency, and is recent or updated are all factors to consider. If an ASTM test method is available, there may be data obtained from tests performed in accordance with standard ASTM

methods. Note that qualitative ratings of “poor,” “good,” or “excellent” give little to no indication of how a material may perform against various chemicals and with regard to the specific needs of EO service.

EO permeation data for clothing, glove, and boot materials are presented in Tables 7.3, 7.4, and 7.5 below.

## Respiratory Protection

If the presence of EO in excess of exposure limits is expected or detected, OSHA regulations dictate that respiratory protection consisting of a NIOSH-approved respirator must be used. The OSHA EO standard, 29 CFR 1910.1047, provides minimum standards for respiratory protection for airborne EO (Table 7.2).

**Table 7.2 OSHA Minimum Standards for Respiratory Protection for Airborne Ethylene Oxide**

Airborne EO Concentration or Condition of Use	Minimum Required Respirator Type
Less than or equal to 50 ppm	Full facepiece with EO-approved canister, front or back mounted
Less than or equal to 2,000 ppm	(A) Positive-pressure supplied air equipped with full facepiece, hood or helmet, or  (B) Continuous-flow supplied air (positive pressure) equipped with hood, helmet or suit
Above 2,000 ppm or unknown (such as in emergencies)	(A) Positive-pressure self contained breathing apparatus (SCBA), or  (B) Positive-pressure full facepiece supplied air respirator equipped with an auxiliary positive-pressure self-contained breathing apparatus
Firefighting	Positive-pressure self-contained breathing apparatus (SCBA), equipped with full face-piece
Escape	Any respirator described above

**IMPORTANT NOTE for Tables 7.3, 7.4, and 7.5:** Data and characterizations of performance are provided as reported by materials manufacturer, from published literature or government sources, or from other databases. Data entered as “EOIC 1990 Data” is from materials permeation testing sponsored by the Ethylene Oxide Industry Council (now the Ethylene Oxide/Ethylene Glycols Panel) and published by Stull, Pinette, and Green (1990). The data displayed is for information purposes only; the data displayed does not constitute an endorsement or recommendation of any particular material of construction or PPE manufacturer. Note that some materials have been tested more than once by more than one party, as indicated by multiple results. Manufacturers may change materials selection or formulation at any time which may change breakthrough times and other performance characteristics of the PPE. Before making any PPE selection, contact the supplier for specific product information, suitability for use in EO service, and current information on test data regarding the manufacturer’s products. “NS” means not specified in test data. PPE names and/or descriptions may be trademarked by the manufacturer.
